

Preoperative steps

Consider discontinue of antiplatelets and anticoagulants usage

Slide 1

1 week prior: Steroids eye drops and YAG iridotomy

Slide 2

15-30 minutes prior: apply Iopidine 0.1% or similar and Pilocarpine 2%

Slide 3

Consider discontinue of antiplatelets and anticoagulants usage

- Antiplatelets and anticoagulants discontinuation should favorably be considered based on the patient's medical condition.

1 week prior - Steroids eye drops and YAG iridotomy

- Steroids eye drops 2-4 times a day in addition to current medication. This to get a quiet eye and avoid SC bleeding.
- YAG iridotomy to phakic patients in the intended quadrant. Can be done also on the surgery day.

15-30 minutes prior: apply Iopidine 0.1% or similar and Pilocarpine 2%

- Apply Iopidine 0.1% drops or a similar vasoconstrictor with a strong effect on the blood vessels and only mild mydriatic effect. This, to constrict blood vessels and avoid SC bleeding.
- Apply Pilocarpine 2% to stretch the iris and make maximum room for the device in the angle and constrict the pupil to obtain maximum protection to the lens.
